

Transforming Technology Into Solution

Our Expertise:

- Check Point
- LDAP
- Site Minder
- Digital Certificates
- SSL
- Windows Active Directory

Our risk management expert understand effectiveness of current security controls implemented, as well as how to improve them.

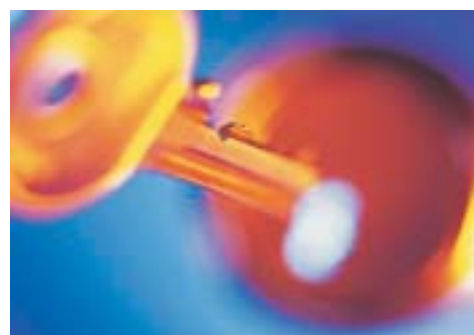

Security Assessments

Softek International assessment methodology focuses on discovering weaknesses in security mechanisms employed by the client to protect the information contained within their network. The assessment process identifies inconsistencies between corporate security policy and deployed information security controls. Softek International assessment team will analyze client-implemented security controls, attempting to gain access to the client network by bypassing the deployed access control mechanisms. Auditing, data integrity, access control, identification and other security controls will be analyzed and verified.

Network and Application Security Design

Design of robust security solutions can, in most cases, be approached by consideration of these basic principles:

- Verification of user's identity
- Access control to the protected data
- Protection of privacy and integrity of the data transfer
- Auditing of user activity and monitoring of abuse
- Matching redundancy requirements of the protected application
- Adherence to client's security policy standards.

Our Consultants have long-standing experience in designing and deploying security solutions for clients in many industries of varying sizes and budgets.

Security Policy Development

The purpose of security policy development is to establish an overall framework for protecting client's valuable data resources. In developing a client's security policy, Softek International pays a great deal of attention to understanding client's organization's business and IT objectives. There is a multitude of issues we consider when designing a security policy:

- Personnel that should be involved in the review and development process
- Resources that should be protected
- Value classification of your asset
- Risk analysis and entities clients which clients wish to protect data
- Internal and external IT infrastructure
- Mobile computing requirements and methods
- Auditing and accountability
- Incident definitions and response procedures
- Business continuity

Softek International pays a great deal of attention understanding clients' business and IT objective. We develop and organize data classification, control measures, network infrastructure and computing standards while designing security policy.

Implementation Services

Softek International Provides implementation services in following areas:

- Fire walls
- Site-to-site VPN
- High Availability/Load Balancing
- Internet access redundancy strong Authentication
- Host and Network Intrusion Detection
- VPN remote access
